this is the second volume of a series of books in various aspects of mathematical physics mathematical physics has made great strides in recent years and is rapidly becoming an important discipline in its own right the fact that physical ideas can help create new mathematical theories and rigorous mathematical theorems can help to push the limits of physical theories and solve problems is generally acknowledged we believe that continuous contacts between mathematicians and physicists and the resulting dialogue and the cross fertilization of ideas is a good thing this series of studies is published with this goal in mind the present volume contains contributions which were originally presented at the second nato advanced study institute on mathematical physics held in istanbul in the summer of 1972 the main theme was the application of group theoretical methods in general relativity and in particle physics modern group theory in particular the theory of unitary

irreducible infinite dimensional representations of Lie groups is being increasingly important in the formulation and solution of dynamical problems in various branches of physics there is moreover a general trend of application of the methods of general relativity and elementary particle physics we hope it will be useful to present these investigations to a larger audience

this book provides a step by step approach to the facilities available in Maple Reduce and Sheep three innovative computer algebra systems for performing calculations relevant to general relativity theory research beginning with Maple and Reduce two widespread general purpose systems the authors describe how currently available packages perform tetrad coordinate system and Poincaré gauge theory calculations a section on Sheep and Stensor offers expert guidance on how they can be used to tackle a wide range of calculations in general relativity including the manipulation of indicial formulae with algebraic computing in general relativity in hand students and researchers in mathematical physics and general relativity theory have an indispensable practical overview of the subject

this volume consists of thirteen papers on algebraic combinatorics and related areas written by leading experts around the world there are four survey papers illustrating the following currently active branches of algebraic combinatorics vertex operator algebras spherical designs Kerdock codes and related combinatorial objects and geometry of matrices the remaining nine papers are original research articles covering a wide range of disciplines from classical topics such as permutation groups and finite geometry to modern topics such as spin models and invariants of 3 manifolds two papers occupy nearly half the volume and present a comprehensive account of new concepts combinatorial cell complexes by M. Aschbacher and quantum matroids by P. Terwilliger Terwilliger's theory of quantum matroids unites a part of the theory of finite geometries and a part of the theory of distance regular graphs great progress is expected in this field K. Nomura's paper bridges the classical and the modern by establishing a connection between certain bipartite distance regular graphs and spin models all contributors to this volume were invited speakers at the conference algebraic combinatorics in Fukuoka Japan 1993 and participated in the research institute in the mathematical sciences RIMS research project on algebraic combinatorics held at Kyoto University in 1994
